 QBID:1012040

Read the following passage and answer the question below :

"It is often assumed that a 'scientific' approach will and should be followed, in which a hypothesis is formulated and then tested using precise measurement techniques. Such research definitely exists, but the view that this is how research should be done is by no means universally shared. Considerations of this kind are referred to as epistemological ones. They raise questions about, and invite us to reflect upon, the issue of how the social world should be studied and whether a scientific approach is the right stance to adopt. Some researchers favour an approach that eschews a scientific model, arguing that people and social institutions are very different from the subject matter of the scientist and that an approach is needed that is more sensitive to the special qualities of people and their social institutions." What is the central thrust that the author expounds in the passage?

- (1) The questioning of the 'scientific' model by some researchers and their call for a different approach
- (2) Exalting the scientific model
- (3) We must raise questions
- (4) People and social Institutions are very different
