# CLASS X SCIENCE NOTES

Key Notes and Important  
Questions with Answers

## HOW DO ORGANISMS REPRODUCE?

## Chapter - 8

# How do Organisms Reproduce

- Reproduction is the process by which living organisms produce new individuals similar to themselves. It ensures continuity of life on earth.
- Nucleus of the cell contains DNA (Deoxyribose Nucleic Acid) which is the heredity material.
- DNA replicates and forms new cells causing variation. So, these new cells will be similar but may not be identical to original cell.
- Variations are useful for the survival of the individual and species over time as well as basis for evolution.

### Types of Reproduction

#### (a) Asexual Reproduction

- A single individual give rise to new individual.
- Gametes are not formed.
- New individual is identical to parent.
- It is extremely useful as a means of rapid multiplication.
- Adopted by lower organisms.

#### (b) Sexual Reproduction

- Two individuals i.e., one male and one female are needed to give rise to new individual.
- Gametes are formed.
- New individual is genetically similar but not identical to parents.
- It is useful to generate more variations in species.
- Adopted by higher organisms.

## Modes of Asexual Reproduction

(i) **Fission** : The parent cell divides into daughter cells.

- **Binary fission** : 2 cells are formed. *E.g.*, amoeba.
- **Multiple fission** : Many cells are formed. *E.g.*, Plasmodium.

### Binary fission in Amoeba

(ii) **Fragmentation** : The organism breaks-up into smaller pieces upon maturation, each piece develops into new individual. *E.g.*, Spirogyra.

### Fragmentation in Spirogyra

(iii) **Regeneration** : If organism is somehow cut or broken into many pieces, each piece grows into a complete organism. *E.g.*, Planaria, Hydra.

### Regeneration in Planaria and Hydra

(iv) **Budding** : A bud is formed which develops into tiny individual. It detaches from parent body upon maturation and develops into new individual. *E.g.*, Hydra

### Budding in Hydra

(v) **Vegetative Propagation** : In many plants, new plants develop from vegetative parts such as :

- By roots : *E.g.*, dahlias, sweet potato.
- By stem : *E.g.*, potato, ginger.
- By leaves : *E.g.*, bryophyllum (leaf notches bear buds which develop into plants).
- Artificial methods :

(a) Grafting : *E.g.*, Mango

(b) Cutting : *E.g.*, Rose

(c) Layering : *E.g.*, Jasmine

(d) **Tissue culture** : New plants are grown by using growing tip of a plant. These growing cells are kept in a culture medium which leads to the formation of callus. Callus is then transferred to hormone medium which causes growth and differentiation. *E.g.*, ornamental plants, orchid.

### Benefits of tissue culture :

- We can grow plants like banana, rose, jasmine etc. that have lost the capacity to produce seeds.
- New plants are genetically similar to parents.
- Helps in growing seedless fruits.

(vi) **Spore Formation** : Spores are small bulb-like structures which are covered by thick walls. Under favourable conditions, they germinate and produce a new organism.

**Spore formation in Rhizopus**

## Sexual Reproduction

When reproduction takes place as a result of the fusion of male and female gametes is called sexual reproduction.

Fusion of gametes is called fertilization which results in variation.

## Sexual Reproduction in Plants

- Flowers are the reproductive organs of plants.
- A typical flower consists of four main whorls namely sepals, petals, stamen and pistil.

## Types of Flowers

- **Bisexual flower** : Both male and female reproductive parts are present.  
*E.g., Hibiscus, mustard.*
- **Unisexual flower** : Either male or female reproductive part is present.  
*E.g., Papaya, watermelon.*

## Structure of Flower :

## Process of Seed Formation

- Pollen grains, produced in the anther, are transferred to the stigma of same flower (self pollination) or stigma of another flower (cross pollination) through agents like air, water or animals.
- Pollen grains germinate and form pollen tubes which pass through style to reach upto the ovules present in ovary.
- The fusion of male and female gametes is called fertilization. Zygote is produced inside the ovary.
- Zygote divides to form embryo. Ovule develops thick coat and changes into seed gradually.
- Ovary changes into fruit and other parts of flower fall off.

### Germination of pollen on stigma

- The seed germinates to form a plant under suitable conditions such as air, moisture etc.

## Reproduction in Human Beings

- Humans use sexual mode of reproduction.
- **Sexual maturation** : The period of life when production of germ cells *i.e.*, ova (female) and sperm (male) start in the body. This period of sexual maturation is called puberty.

## Changes at Puberty

### (a) Common in male and female

- Thick hair growth in armpits and genital area.
- Skin becomes oily, may result in pimples.

### (b) In girls

- Breast size begin to increase.
- Girls begin to menstruate.

### (c) In boys

- Thick hair growth on face.
- Voice begin to crack.

These changes signals that sexual maturity is taking place.

## Male Reproductive System

**(a) Testes :** A pair of testes are located inside scrotum which is present outside the abdominal cavity. Scrotum has a relatively lower temperature needed for the production of sperms.

- Male germ cell *i.e.*, sperms are formed here.
- Testes release male sex hormone (testosterone). Its function is :
  - (i) Regulate production of sperms.
  - (ii) Bring changes at puberty.

**(b) Vas deferens :** It passes sperms from testes upto urethra.

**(c) Urethra :** It is a common passage for both sperms and urine. Its outer covering is called penis.

**(d) Associated glands :** Seminal vesicles and prostate gland add their secretion to the sperms. This fluid provide nourishment to sperms and make their transport easy.

Sperm alongwith secretion of glands form semen.

**Human – male reproductive system**

## Female Reproductive System

(a) **Ovary** : A pair of ovary is located in both sides of abdomen.

- Female germ cells *i.e.*, eggs are produced here.
- At the time of birth of a girl, thousands of immature eggs are present in the ovary.
- At the onset of puberty, some of these eggs start maturing.
- One egg is produced every month by one of the ovaries.

(b) **Oviduct or Fallopian tube**

- Receives the egg produced by the ovary and transfer it to the uterus.
- Fertilisation *i.e.*, fusion of gametes takes place here.

(c) **Uterus** : It is a bag-like structure where development of the baby takes place.

- Uterus opens into vagina through cervix.

**Fig. Human – female reproductive system**

### When egg is fertilised :

- The fertilized egg called zygote is planted in uterus and develops into an embryo.
- The embryo gets nutrition from the mother's blood with the help of a special tissue called placenta. It provides a large surface area for the exchange of glucose, oxygen and waste material.
- The time period from fertilization upto the birth of the baby is called gestation period. It is about 9 months.

## When egg is not fertilised :

- The uterus prepares itself every month to receive fertilized egg.
- The lining of the uterus becomes thick and spongy, required to support the embryo.
- When fertilisation had not taken place, this lining is not needed any longer.
- This lining breaks and comes out through vagina as blood and mucus. This cycle takes around 28 days every month and called menstruation.

## Reproductive Health

Reproductive health means a total well-being in all aspects of reproduction *i.e.*, physical, emotional, social and behavioural.

## Sexually Transmitted Diseases (STDs)

- Many diseases can be sexually transmitted such as :  
**Bacterial** : Gonorrhoea and syphilis  
**Viral** : Warts and HIV-AIDS
- Use of condom prevents these infections to some extent.

## Contraception

It is the avoidance of pregnancy, can be achieved by preventing the fertilisation of ova.

## Methods of contraception

### (a) Physical barrier

- To prevent union of egg and sperm.
- Use of condoms, cervical caps and diaphragm.

### (b) Chemical methods

- Use of oral pills
- These change hormonal balance of body so that eggs are not released.
- May have side effects.

### (c) Intrauterine contraceptive device (IUCD)

- Copper-T or loop is placed in uterus to prevent pregnancy.

#### (d) Surgical methods

- In males the vas deferens is blocked to prevent sperm transfer called vasectomy.
- In females, the fallopian tube is blocked to prevent egg transfer called tubectomy.

### Female Foeticide

- The practice of killing a female child inside the womb is called female foeticide.
- For a healthy society, a balanced sex ratio is needed that can be achieved by educating people to avoid malpractices like female foeticide and prenatal sex determination.
- Prenatal sex determination is a legal offence in our country so as to maintain a balanced sex ratio.

## QUESTIONS

### VERY SHORT ANSWER TYPE QUESTIONS (1 Mark)

1. Name the two types of reproduction.
2. What type of reproduction takes place in plasmodium ?
3. Define vegetative propagation.
4. Where is DNA present in a cell ?
5. Name the glands associated with male reproductive system.
6. What is menstruation ?
7. Name two contraceptive methods.
8. Where are the reproductive parts located in a plant ?

### SHORT ANSWER TYPE QUESTIONS (2 Marks)

1. Write two important functions of testosterone.
2. What is placenta ? Also write its functions.
3. Why do we see different types of organisms around us ?
4. What is the importance of variation ?
5. Why is vegetative propagation practiced for growing some types of plants ?

6. Write names of male and female sex hormones.
7. Mention the parts of a flower.
8. Differentiate between bisexual and unisexual flowers.

### **SHORT ANSWER TYPE QUESTIONS (3 Marks)**

1. What is tissue culture ?
2. Explain the process of fertilisation in flowering plants.
3. Name the different constituents of semen.
4. Draw a well-labelled diagram of male reproductive system.
5. What is pre-natal sex determination ? Why is it banned ?
6. Draw a labelled diagram of the longitudinal section of a flower.

### **LONG ANSWER TYPE QUESTIONS (5 Marks)**

1. What are the different modes of asexual reproduction ?
2. Draw a labelled diagram of female reproductive system and write the function of its different parts.
3. What is contraception ? Give different methods of contraception.
4. What happens in human female :
  - (a) when egg is fertilised ?
  - (b) when egg is not fertilised ?
5. Trace and explain the steps involved in the formation of seed.

### **Hints to Long Answer Type Questions**

1. Methods of asexual reproduction :
  - (a) Fission
  - (b) Fragmentation
  - (c) Regeneration
  - (d) Budding
  - (e) Vegetative propagation
  - (f) Spore formation

2. Labelled diagram of female reproductive system.

**Functions :**

**Ovary :** Production of eggs.

**Oviduct :** Site for fertilization.

**Uterus :** Place of development of embryo.

3. **Contraception :** Barrier for fertilisation.

- Physical barrier
- Chemical methods
- Surgical methods
- Intrauterine contraceptive device (IUCD)

4. (a) (i) Zygote is formed → Implanted in uterus

(ii) Onset of pregnancy

(b) Menstruation

5. Labelled diagram of germination of pollen grain on stigma of flower.
