Comprehension:

Read the following passage and answer questions

Perhaps what bothered the media in 1970s was the shift in liberty being suggested. For centuries, journalists had operated on the basis of negative liberty, or freedom from external restraints. Suddenly, however, the thrust was positive freedom, a freedom for pursuit of some predetermined goals. This new social responsibility seems grounded on a school of thought that sees negative liberty as insufficient and ineffective, somewhat like telling people they are free to walk without first making sure they are not crippled. Who better than government is able to provide humanity with appropriate means? Government, even a democratic government, is seen by social responsibility adherents as the only force strong enough to guarantee effective operation of freedom. This does not mollify observers who find social responsibility to be only slightly disguised version of authoritarianism. Media philosopher John Merrill has been one of the most outspoken critics of the theory. To him, the proposition that pluralism of ideas should be governmentally mandated is ludicrous. Journalists, he says, must retain their freedom to make their own news and editorial judgements. Even well intentioned attempts by outside groups seeking media improvement are self serving, and inevitably lessen the autonomy of journalists, Merrill maintains. This leads us to the issue of media autonomy.

Read the following paragraph and answer the five questions which follow :

A psychologist wanted to develop an achievement test in Chemistry for SSC students of central schools. For this purpose, he wrote 110 items having multiple-choice format. He administered this draft version to a sample of 300 subjects. Item analysis was carried out by computing item-remainder correlations. The item analysis retained 80 items. The eighty-item version was administered to a fresh sample of 400 subjects which yielded a mean of 40.00 and standard deviation of 8.00. The scores were found to be normally distributed. Cronbach alpha for eighty-item version was found to be 0.94. The psychologist also computed odd-even reliability and Kuder-Richardson (K-R) reliability for this version. On this version, one of the subjects Manas, had a score of 32. Since the eighty-item version was considered long for administration, two forms, Form A and Form B were prepared by randomly assigning 40 items to each form.

Read the following paragraph and answer the five questions which follow :

A researcher wanted to study the effect of organization of material (A) on recall. She expected that retention interval (B) would moderate the effect of organization of material. She varied A at three levels—Low organization, Moderate organization, and High organization. She varied B at two levels—Short retention interval and Long retention interval. The subjects were randomly assigned to the different groups. Each subject received the list of words with specified level of organization. Each of them learnt the list upto one errorless trial and was tested after the specified retention interval. All the subjects had also received the intelligence test. The number of items, recalled by the subject, was the dependent variable. The data were analyzed by the appropriate ANOVA, treating intelligence as a covariate. The partial results are given here—(i) the sum of squares for organization of material (A) was 255.00; (ii) the degrees of freedom for error variance was 115; (iii) the F ratio for interaction ($A \times B$) was 0.95. The obtained results were appropriately interpreted.

Q.97

From the above results, it can be concluded that

1. main effect of organization of material is significant
2. main effect of organization of material is non-significant
3. retention interval does not moderate the effect of organization of material
4. retention interval moderates the effect of organization of material

Options 1. 1

2. 2
3. 3
4. 4

Status : Answered

Chosen Option : 1

Comprehension:

Read the following paragraph and answer the five questions which follow :

A researcher wanted to study the effect of organization of material (A) on recall. She expected that retention interval (B) would moderate the effect of organization of material. She varied A at three levels—Low organization, Moderate organization, and High organization. She varied B at two levels—Short retention interval and Long retention interval. The subjects were randomly assigned to the different groups. Each subject received the list of words with specified level of organization. Each of them learnt the list upto one errorless trial and was tested after the specified retention interval. All the subjects had also received the intelligence test. The number of items, recalled by the subject, was the dependent variable. The data were analyzed by the appropriate ANOVA, treating intelligence as a covariate. The partial results are given here—(i) the sum of squares for organization of material (A) was 255.00; (ii) the degrees of freedom for error variance was 115; (iii) the F ratio for interaction ($A \times B$) was 0.95. The obtained results were appropriately interpreted.
